

## Analysis of Algorithms-Homework3

**Due Tuesday, March 6, 2018, 11:59 PM**

### 2-4 Inversions

Let  $A[1..n]$  be an array of  $n$  distinct numbers. If  $i < j$  and  $A[i] > A[j]$ , then the pair  $(i, j)$  is called an *inversion* of  $A$ .

- a. List the five inversions of the array  $\langle 2, 3, 8, 6, 1 \rangle$ .
- b. What array with elements from the set  $\{1, 2, \dots, n\}$  has the most inversions? How many does it have?
- c. What is the relationship between the running time of insertion sort and the number of inversions in the input array? Justify your answer.
- d. Give an algorithm that determines the number of inversions in any permutation on  $n$  elements in  $\Theta(n \lg n)$  worst-case time. (*Hint*: Modify merge sort.)

### 3-3 Ordering by asymptotic growth rates

- a. Rank the following functions by order of growth; that is, find an arrangement  $g_1, g_2, \dots, g_{30}$  of the functions satisfying  $g_1 = \Omega(g_2)$ ,  $g_2 = \Omega(g_3)$ ,  $\dots$ ,  $g_{29} = \Omega(g_{30})$ . Partition your list into equivalence classes such that functions  $f(n)$  and  $g(n)$  are in the same class if and only if  $f(n) = \Theta(g(n))$ .

$\lg(\lg^* n)$	$2^{\lg^* n}$	$(\sqrt{2})^{\lg n}$	$n^2$	$n!$	$(\lg n)!$
$(\frac{3}{2})^n$	$n^3$	$\lg^2 n$	$\lg(n!)$	$2^{2^n}$	$n^{1/\lg n}$
$\ln \ln n$	$\lg^* n$	$n \cdot 2^n$	$n^{\lg \lg n}$	$\ln n$	1
$2^{\lg n}$	$(\lg n)^{\lg n}$	$e^n$	$4^{\lg n}$	$(n+1)!$	$\sqrt{\lg n}$
$\lg^*(\lg n)$	$2^{\sqrt{2 \lg n}}$	$n$	$2^n$	$n \lg n$	$2^{2^{n+1}}$

- b. Give an example of a single nonnegative function  $f(n)$  such that for all functions  $g_i(n)$  in part (a),  $f(n)$  is neither  $O(g_i(n))$  nor  $\Omega(g_i(n))$ .

### A.2-4

Approximate  $\sum_{k=1}^n k^3$  with an integral.

**4.5-1**

Use the master method to give tight asymptotic bounds for the following recurrences.

*a.*  $T(n) = 2T(n/4) + 1.$

*b.*  $T(n) = 2T(n/4) + \sqrt{n}.$

*c.*  $T(n) = 2T(n/4) + n.$

*d.*  $T(n) = 2T(n/4) + n^2.$

**4-3 More recurrence examples**

Give asymptotic upper and lower bounds for  $T(n)$  in each of the following recurrences. Assume that  $T(n)$  is constant for sufficiently small  $n$ . Make your bounds as tight as possible, and justify your answers.

*a.*  $T(n) = 4T(n/3) + n \lg n.$

*b.*  $T(n) = 3T(n/3) + n/\lg n.$

*c.*  $T(n) = 4T(n/2) + n^2\sqrt{n}.$

*d.*  $T(n) = 3T(n/3 - 2) + n/2.$

*e.*  $T(n) = 2T(n/2) + n/\lg n.$

*f.*  $T(n) = T(n/2) + T(n/4) + T(n/8) + n.$

*g.*  $T(n) = T(n - 1) + 1/n.$

*h.*  $T(n) = T(n - 1) + \lg n.$

*i.*  $T(n) = T(n - 2) + 1/\lg n.$

*j.*  $T(n) = \sqrt{n}T(\sqrt{n}) + n.$

6. (10 points) Do Problem C.2-9 on p. 1195. You must solve this problem using a clearly defined sample space, a clearly defined probability distribution, and clearly defined events.

**C.2-9 ★**

You are a contestant in a game show in which a prize is hidden behind one of three curtains. You will win the prize if you select the correct curtain. After you

have picked one curtain but before the curtain is lifted, the emcee lifts one of the other curtains, knowing that it will reveal an empty stage, and asks if you would like to switch from your current selection to the remaining curtain. How would your chances change if you switch? (This question is the celebrated **Monty Hall problem**, named after a game-show host who often presented contestants with just this dilemma.)

7. (10 points) Do Problem C.2-10 on p. 1196. You must solve this problem using a clearly defined sample space, a clearly defined probability distribution, and clearly defined events.

**C.2-10 ★**

A prison warden has randomly picked one prisoner among three to go free. The other two will be executed. The guard knows which one will go free but is forbidden to give any prisoner information regarding his status. Let us call the prisoners  $X$ ,  $Y$ , and  $Z$ . Prisoner  $X$  asks the guard privately which of  $Y$  or  $Z$  will be executed, arguing that since he already knows that at least one of them must die, the guard won't be revealing any information about his own status. The guard tells  $X$  that  $Y$  is to be executed. Prisoner  $X$  feels happier now, since he figures that either he or prisoner  $Z$  will go free, which means that his probability of going free is now  $1/2$ . Is he right, or are his chances still  $1/3$ ? Explain.

1. (20 points) Do Problem 2-4 on p. 41.
2. (20 points) Do Problem 3-3 on p. 61.
3. (10 points) Do Problem A.2-4 on p. 1156.
4. (10 points) Do Problem 4.5-1 on p. 96.
5. (20 points) Do Problem 4-3 on p. 108.
